

IN THE CLAIMS

1. (currently amended) A method of securing friction liners on an annular support plate, the support plate having an outer periphery defining a radial blade having opposed lateral faces including at least one lateral fastening face which defines an adhesion zone of predetermined form positioned on the fastening face, the method being a method of adhesively bonding said friction liners on at least one said lateral fastening face and comprising:

- an adhesive applying step which consists in depositing a predetermined quantity of adhesive on an adhesion zone, wherein said deposition of adhesive is carried out by means of an adhesive applicator defining an adhesive applying zone the form of which corresponds to that of said adhesion zone,
- a control step for controlling the application of adhesive on the adhesion zone using an optical system.

2. (previously amended) A method according to Claim 1, wherein the adhesive applying step comprises:

- a first, impregnation, phase which comprises impregnating with adhesive said adhesive applying zone of the applicator head,
- and a second, adhesive applying, phase which comprises the step of bringing the impregnated adhesive applying zone of the applicator head into contact, under axial pressure, with said adhesion zone, whereby to transfer a predetermined quantity of adhesive from the applicator head to said blade of the support plate.

3. (previously amended) A method according to Claim 2, wherein the said second phase further includes applying a backing head against the lateral face of said blade opposed to said lateral fastening face, whereby to apply on said opposed face an axial force opposite to that exerted by the applicator head on said lateral fastening face, thereby avoiding deformation of the blade.

4. (previously amended) A method according to Claim 1, wherein, said opposed lateral faces of each said radial blade being fastening faces, the adhesive applying step comprises the use of two applicator heads, each having a said adhesive applying zone, said adhesive applying zones being in facing relationship to the said adhesion zones of each of the lateral fastening faces, the applicator heads being applied to the two fastening faces simultaneously.

5. (previously amended) A method according to Claim 1, further including, following the adhesive applying step, rotating the support plate whereby to put said adhesion zone on the fastening face of a further said radial blade of the support plate into a position opposite the adhesive applying zone of the applicator head.

6. (currently amended) A method according to Claim 5, ~~further including a~~ wherein said step of controlling the application of adhesive is performed to at least one said lateral fastening face.

7. (currently amended) A method according to Claim 6, wherein said control step comprises using ~~an~~ said optical system to detect the presence of adhesive on said support plate but outside said adhesion zone.
8. (currently amended) A method according to Claim 6, wherein said control step comprises using ~~an~~ said optical system to detect absence of adhesive on at least part of the adhesion zone.
9. (previously amended) A method according to Claim 8, further including the step of rejecting the support plate when said optical system detects at least one situation selected from the group consisting of the presence of adhesive or support plate but outside the adhesion zone and absence of adhesive on at least part of the adhesion zone.
10. (previously amended) A method according to Claim 8, wherein the said control step comprises using said optical system to determine the real position of said adhesion zone, carrying adhesive, with respect to the corresponding said lateral fastening face of said blade, the control step further including comparing said real position with a theoretical position of the adhesion zone, and rejecting the support plate if the two said positions are different from each other.

11. (withdrawn) Apparatus for the adhesive fastening of friction liners on an annular support plate, the said plate having an outer periphery defining at least one radial blade having opposed lateral faces, including at least one fastening face, with an adhesion zone on at least one said lateral fastening face, the apparatus being apparatus for fastening said friction liners adhesively on at least one said lateral fastening face of the support plate, the apparatus including means for depositing a predetermined quantity of adhesive on said adhesion zone, said deposition zone comprising at least one adhesive applicator head defining an adhesive applying zone, and means defining a hollow receptacle for containing adhesive, the apparatus further including means for moving the applicator head between said hollow receptacle and said adhesion zone whereby to take adhesive from the hollow receptacle and deposit the said adhesive in a predetermined quantity on the adhesion zone, the said hollow receptacle being selected from the group consisting of a reservoir and a shallow recess.

12. (withdrawn) Apparatus according to Claim 11, further including means for applying axial pressure between the applicator head and the said adhesion zone, whereby the applicator head can deposit the said predetermined quantity of adhesive on the adhesion zone by contact, under axial pressure, of the adhesion applying zone of the head with the adhesion zone of the support plate.

13. (withdrawn) Apparatus according to Claim 12, further including a backing head for applying counter-pressure against the lateral face of the blade opposed to the lateral fastening face of the blade to which adhesive is to be applied, the said backing head being disposed in opposition to the adhesive applicator head so as to exert an axial force opposed to axial forces exerted by the applicator head, whereby to avoid deformations of the said blade.

14. (withdrawn) Apparatus according to Claim 11, further including means for carrying said support plate and rotating the latter whereby to locate successive lateral fastening faces of different said blades of the support plate in facing relationship with the adhesive applying zone of the applicator head.

15. (withdrawn) Apparatus according to Claim 14, wherein the said means for rotating the support plate include indexing means for positioning successive said adhesion zones in facing relationship with the adhesive applying zone of the applicator head.

16. (withdrawn) Apparatus according to Claim 11, further including means for monitoring the said adhesion zones carrying adhesive.

17. (withdrawn) Apparatus according to Claim 16, wherein the said control means comprise an optical viewing device for viewing the said lateral fastening faces, whereby to monitor at least one characteristic selected from the group consisting of the position of the adhesive zone and the distribution of adhesive on the lateral fastening face.

18. (withdrawn) Apparatus according to Claim 16, wherein the said control means include a weighing device for detecting the quantity of adhesive deposited on at least one said adhesion zone.

19. (withdrawn) Apparatus according to Claim 11, having two said applicator heads, situated in opposed relationship with each other and arranged in facing relationship with two respective opposed adhesion zones of a said blade.

20. (withdrawn) Apparatus according to Claim 11, further including a receptacle for a reserve supply of adhesive, an adhesive reservoir, and feed means connecting the said reservoir with the said receptacle, whereby to maintain adhesive in the reservoir at a filling level higher than a predetermined limiting lower level.

21. (withdrawn) Apparatus according to Claim 11, further including a device for cleaning the adhesive applying zone of the adhesive applicator.
